

Steps to Varicose vein and Spider vein treatment

Step 1

Meet with the doctor. At this visit Dr. Hadjbian will first listen to your concerns. Next, he will perform an examination to determine what is the next step in your treatment. That may be an ultrasound study of your legs or it may be recommendation for treatments. During this visit our office staff will also review your insurance coverage.

Step 2

If an ultrasound study is necessary you will be scheduled for a detailed "Vein mapping study". This study is non-invasive, painless, safe and done in our office. Dr. Hadjbian will review the study and explain it to you in detail the same day that you have the study done. Dr. Hadjbian will then review a comprehensive treatment plan with you.

Step 3

This is the treatment step. We first make sure you have a complete understanding of what needs to be done to achieve optimal results. Next, you can schedule your treatments and get started.

Treatment may include several Gold Standard modalities such as Endovenous thermal ablation, Ultrasound Guided Sclerotherapy, Ambulatory phlebectomy and Visual sclerotherapy. Frequently we combine several of the above procedures to achieve optimal results. At times we may change our plan based on the results of a previous treatment. For example it may not be necessary to perform a certain treatment after Endovenous thermal ablation. You may no longer need it. Therefore, we skip that step. We always review any changes with you so that you are fully informed about your treatments. Never hesitate to ask us questions if you need clarification.

Step 4

Follow up.

We cannot stress how important this step is. Regular follow up is the key to a successful vein treatment. Follow up is usually a short visit with Dr. Hadjbian or an Ultrasound study to assure success and completion of your treatments.
